Scrolling SQL Server data: SQL Server 1.x doesn't support cursors but you  
can still browse SQL Server tables. (Client/Server Advisor) (includes  
related article on remote performance) (Tutorial)  
Menninger, Dave

ABSTRACT: SQL Server 1.x lacks support for database cursors, leaving only two methods to handle results after requested data is successfully identified. Users can either read each row in the order it is returned or abandon the operation and result set. Therefore users cannot perform operations such as SKIP-1 or SQLFETCHPREVIOUS. Developers should be cautious, however, even in SQL databases that offer cursor support to bring data to the workstation only when it is necessary. Developers should use clustered indexes when possible and should look out for stale data. Data is stored in index order under clustered indexes and saves retrieval time significantly, especially if developers only require a few rows. Extensive details on clustered indexes are provided.

REORG PLUS for DOS/VSE  
News Release December 17, 1987 p. 1

REORG PLUS for DOS/VSE, a new product released by BMC Software Inc., performs the unload and reload of a DL/1 data base two to six times faster than the DL/1 HD Reorganization Unload and Reorganization Reload utility programs. Because REORG PLUS for DOS/VSE makes the reorganization occur at a significantly faster rate, it is possible for a DOS/VSE shop to perform a reorganization frequently, improving the online performance of the DL/1 data base as often as on a daily basis. The speed of the reorganization with REORG PLUS also means the data base will be back online sooner. REORG PLUS for DOS/VSE contains three components: an Unload Utility

program, a Reload Utility program and the Load Program Interface of the Reload Utility. It is a functional replacement of the DL/1 Reorganization Unload and Reload utilities and **creates** data bases **identical** in **structure** to those of the DL/1 utilities. REORGE PLUS supports HDAM, HIDAM and HISAM and all current versions of DL/1 and DOS/VSE. Logical relationships and **Secondary Indexes** are also supported. REORG PLUS **creates** empty data bases without a "LOAD" PSB and unloads and reloads compressed data base segments without the need to code a special DBD. Should a twin segment error occur during the reload, the option of continuing or aborting the process is provided. REORG PLUS offers an exit facility for each segment processed. Additionally, if a pointer error is encountered during the unload, a complete snap dump of affected blocks is provided. The Unload utility of REORG PLUS can write abbreviated records in the HD Unload data set if the data base does not contain any logical child segments. The Reload utility will automatically recognize the shorter HD Unload records and because less data must be processed, both utilities will run faster.
